In the Claims:

- 1. A medical procedure for connecting a blood-conveying conduit to a
- 2 blood vessel in a patient's body to provide blood flow outside of the blood vessel,
- 3 the method comprising:
- 4 creating an arteriotomy in the blood vessel at a selected location; and
- forming an anastomosis between the blood-conveying conduit and the blood
- 6 vessel at the selected location to provide blood flow in the blood-conveying
- 7 conduit outside the blood vessel and away from the selected location;
- 8 wherein creating said arteriotomy and forming said anastomosis are both
- 9 performed while the selected location is covered by a substantially intact portion of
- the epidermis of the body.
- 1 2. The medical procedure according to claim 1 in which the blood vessel
- 2 is the aorta.
- 1 3. The medical procedure of claim 2 in which the selected location is
- 2 above the iliac arterial bifurcation of the aorta.
- 1 4. The medical procedure according to claim 2 further comprising:
- 2 positioning an end of the blood-conveying conduit outside the blood vessel
- 3 and near the arteriotomy at the selected location; and

- anastomosing the end portion of the blood-conveying conduit to the selected location.
- 5. A medical procedure for connecting a blood-conveying conduit to the aorta in a patient's body, the method comprising:
- 3 creating an arteriotomy in the aorta at a selected location;
- 4 position an end of the blood-conveying conduit near the arteriotomy at the
- 5 selected location; and
- anastomosing the end portion of the blood-conveying conduit and the aorta
- 7 at the selected location;
- 8 wherein creating said arteriotomy and forming said anastomosis are both
- 9 performed while the selected location is covered by a substantially intact portion of
- the epidermis of the body; and
- wherein the blood-conveying conduit is positioned via an initial entry at a
- location relative to a femoral artery below the inguinal ligament.
- 1 6. A medical procedure for connecting a blood-conveying conduit to a
- 2 blood vessel, the method comprising:
- 3 creating an arteriotomy in the blood vessel at a selected location;
- forming an anastomosis between the blood-conveying conduit and the blood
- 5 vessel at the selected location; and

- positioning a visualization device adjacent the selected location while creating said arteriotomy and forming said anastomosis.
- 7. A medical procedure for connecting a blood-conveying conduit to an aorta, the method comprising:
- positioning an end of an instrument having a lumen therethrough near a selected location along the aorta;
- advancing an end portion of the blood-conveying conduit through the lumen of the instrument to the selected location adjacent the aorta; and
- forming an anastomosis between said blood-conveying conduit and the aorta at the selected location.
- 1 8. The medical procedure according to claim 7 further comprising:
- 2 positioning an end of an endoscope having a lumen therethrough near the
- 3 selected location; and
- advancing an end position of the blood-conveying conduit through the
- 5 lumen of the endoscope to the selected location.
- 9. A medical procedure for connecting a blood-conveying conduit to an
- 2 aorta, the method comprising:
- positioning an end of an endoscope having a lumen therethrough near a
- 4 selected location along the aorta;

5	advancing an end portion of the blood-conveying conduit through the lumen
6	of the endoscope to the selected location adjacent the blood vessel; and
7	forming an anastomosis between the said blood-conveying conduit and the
8	aorta at the selected location;
9	wherein the endoscope is positioned via an initial entry at a location relative
10	to a femoral artery below the inguinal ligament.
1	10. A medical procedure for connecting a blood-conveying conduit to a
2	blood vessel, the method comprising:
3	advancing an end portion of the blood-conveying conduit to a selected
4	location adjacent the blood vessel;
5	positioning an end of an instrument having a lumen therethrough near a
6	selected location along the blood vessel;
7	manipulating a surgical device extending through the lumen in the
8	instrument to create an arteriotomy in the blood vessel at the selected location; and
9	thereafter
10	forming an anastomosis between the blood-conveying conduit and the blood

1 11. A method of bypassing a restriction in an artery of a mammal, the method comprising:

vessel at the selected location.

11

- providing a graft having a body portion with a first end, a second end and a
- 4 lumen therebetween;
- forming a first aperture in a first artery;
- forming a second aperture in a second artery distal of the restriction;
- 7 placing the graft between the first aperture in the first artery and the second
- 8 aperture in the second artery;
- 9 inserting an expandable stent intravascularly from a location remote from
- the first aperture for positioning in the first artery at the location of the first
- 11 aperture;
- expanding the stent to connect the first end of the graft within the first
- 13 artery; and
- attaching the second end of the graft to the second aperture in the second
- 15 artery.
- 1 12. The method of claim 11 wherein the first artery is the aorta.
- 1 13. The method of claim 11 wherein the second end of the graft is
- 2 attached by suturing.

- 1 14. The method of claim 11 wherein expanding the stent comprises:
- 2 expanding the stent radially outward to lie against an interior wall of the first
- 3 artery.
